

IO SKY

Homepage

Developer Visual Specification

Desktop composition · typography · spacing · Orange emphasis · glass surfaces

Purpose

This document is the visual implementation reference for the IO SKY homepage. It defines hierarchy, placement, spacing, typography, colour emphasis and material treatment so the developer does not have to infer the intended composition.

WARM DEEP TEAL #1C4744

Implementation system

Use these values as the baseline for the complete page. Preserve the relationships between values when adapting responsively.

CANVAS

1440px desktop target
Warm Deep Teal #1C4744
No hard section dividers

CONTENT

Max content width: 1200px
Left/right safe margin: 96-120px
Text measure: 520-660px

VERTICAL RHYTHM

Section padding: 128-160px
Headline → body: 32-40px
Paragraph rhythm: 20-28px

TYPE SCALE

Eyebrow: 12-14px / 600
H1: 64-72px / 0.98-1.04
H2: 44-52px / 1.04-1.10
Body: 18-20px / 1.55-1.70

ORANGE

Primary #F58A1F
Use semantically, not decoratively
CTA / active / selected emphasis

GLASS

rgba(12,47,51,.58)
Blur 20-24px
1px white ~10% border
Soft highlight, no heavy shadow

Transparent at hero top · glass after scroll

IO SKY Infrastructure Intelligence Solutions AI Scan About Contact Login **Book Call**

Top state: transparent over the hero. Scrolled state: darker glass, never near-black. Main nav text stays off-white; hover/focus/active turns Orange.

No separator line below the navbar. Logo has visibly more breathing room before the first navigation item.

Technology should not define how your **business works.** It should be designed around it.

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

IO SKY designs and builds the operational infrastructure behind growing businesses - shaped around how the organisation actually needs to function.

What makes sense on its own does not always work as one.

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

A growing team introduces another tool.

A spreadsheet solves something that could not wait.

A system is added because one part of the business needs it.

Individually, these can all be sensible decisions.

But businesses rarely grow through one perfectly coordinated plan. They grow through hundreds of decisions made at different moments, for different reasons, by different people.

Over time, those decisions begin to depend on one another.

What was built to solve individual problems starts becoming the infrastructure the whole business relies on.

The problem you see is not always where the problem begins.

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

A process takes too long, so automation seems like the answer.

A team lacks visibility, so a dashboard seems necessary.

A system no longer fits, so replacing it appears to be the logical next step.

Sometimes that is exactly right.

But when systems, information and processes depend on one another, the place where friction becomes visible is not necessarily the place where it originates.

Solve only what is visible, and one problem can disappear while the dependency behind it remains.

The better question is not always: what should we add or change?

Sometimes it is: **why is this problem here in the first place?**

First understand how the **business needs to work.** Then decide what **technology needs to do.**

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

Before IO SKY decides what should be connected, automated, changed or built, we first look at the organisation itself.

What needs to happen? What depends on what? Where are decisions made? And what needs to become possible next?

Only then can we determine where technology adds value - and what role it should play.

The solution follows from that understanding.

The parts matter. So does **what happens between them.**

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

A process can depend on information created somewhere else.

A decision can determine what another team needs to do next.

A system can affect work far beyond the people who use it directly.

A change in one place can therefore create consequences somewhere entirely different.

IO SKY treats those relationships as part of the design - not as something to solve afterwards.

Because what connects the parts can be just as important as the parts themselves.

What the business needs determines **what comes next.**

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

Once the problem and the relationships around it are understood, the answer can take different forms.

Foundation

The structural basis that allows systems, information, access and change to function reliably together.

Explore Foundation →

Intelligence

Capabilities that turn reliable information and connected operations into visibility, automation, better decisions and intelligent action.

Explore Intelligence →

Solutions

Systems, software and operational solutions designed around what the organisation actually needs to accomplish.

Explore Solutions →

The business does not separate software, data, automation and infrastructure when the work depends on all of them.

Neither do we.

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

A process can cross systems.

A decision can depend on information created elsewhere.

Automation can depend on infrastructure, access and human judgement at the same time.

Treat those as separate technical problems, and each solution can work while the organisation around them becomes more complicated.

IO SKY looks across those boundaries.

We use software, automation, data, infrastructure and intelligence as parts of one operational design - choosing what is needed based on the problem, rather than fitting the problem to a predefined service.

That also means knowing when not to add more.

Keep what works. Change what gets in the way. **Build what genuinely adds value.**

You cannot predict what the business will need next. You can **make it easier to change** when it does.

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

New customers arrive.

Teams evolve.

Processes change.

New systems become relevant.

New information becomes valuable.

And capabilities that matter tomorrow may not even exist today.

The answer is not to predict every future requirement.

It is to make sure that what is built today does not make tomorrow unnecessarily difficult.

That means designing systems, information and relationships so that change can be absorbed without forcing the organisation to start again every time something new becomes important.

Good infrastructure does not predict what comes next.

It **makes what comes next easier to accommodate.**

What does your business need to be able to do next?

ORANGE EMPHASIS

Use only on meaning-bearing words / CTA states - not every headline by default.

Maybe the next step is automation.

Maybe systems need to work together differently.

Maybe information needs to become more reliable or more useful.

Maybe a new platform needs to be built.

Or maybe the real problem has not yet been identified.

You do not need to arrive with the technical answer.

Start with **what the business needs to accomplish.**

We can determine what needs to exist behind it.

Do not infer the visual hierarchy

01 Build from the spacing and type relationships shown here; do not compress sections to fit more above the fold.

02 Keep the dominant page field Warm Deep Teal #1C4744. Avoid black/navy substitutions and avoid visible grids or decorative section separators.

03 Orange #F58A1F is semantic: primary CTA, active/hover/focus, selected emphasis and occasional meaning-bearing words. Do not paint every section headline Orange.

04 Glass must read as a distinct darker translucent material: 20-24px blur, subtle white edge/highlight, no opaque card look and no heavy shadow.

05 Use generous text measure and whitespace. Never let visual assets, glass cards, lines, icons or decorative elements overlap copy.

06 Responsive implementation may reflow, but must preserve hierarchy: eyebrow → headline → body → supporting visual/CTA. Mobile should not become a dense stack.

07 All copy in this document is treated as the homepage master. Do not rewrite, shorten or substitute copy during implementation without Product Owner approval.
