
01 — SOLUTIONS

Start with the **business**. Build what it requires.

What the business needs to achieve rarely depends on one system or process alone.

IO SKY brings together what the business needs into one coherent solution.

Every solution has a different starting point.

A solution can begin with growth, with the way the business operates, or with a requirement unique to the business.

Growth Ecosystem

Create, structure or strengthen how commercial growth happens.

For businesses building their first repeatable commercial process, scaling what already works or bringing greater control to a complex revenue operation.

The capabilities below are representative examples. Each Growth Ecosystem is composed around what the business is trying to achieve — not around a fixed package.

Market & Acquisition

Identify the right markets, accounts and potential customers — and create effective ways to reach and acquire them.

EXAMPLES INCLUDE

Market targeting · Account identification · Buying signals · Demand generation · Acquisition flows

Revenue, Sales & Intelligence

Turn commercial potential into focused sales activity by identifying, qualifying, engaging and developing the opportunities that matter.

EXAMPLES INCLUDE

Lead qualification · Personalised outreach · Sales sequencing · Opportunity intelligence · Sales assistance

Pipeline & Commercial Processes

Create structure around how commercial opportunities move from initial interest to agreement, with clear stages, ownership and progression.

EXAMPLES INCLUDE

CRM workflows · Opportunity management · Pipeline orchestration · Proposal & approval flows · Commercial handover

Customer Growth

Recognise and act on opportunities to retain, renew and expand existing customer relationships.

EXAMPLES INCLUDE

Retention signals · Renewal management · Churn-risk detection · Upsell & cross-sell · Account expansion

Growth Intelligence & Optimisation

Make commercial performance visible across the growth operation — so the business can see what is working, where momentum is being lost and where improvement matters.

EXAMPLES INCLUDE

Funnel performance · Attribution · Pipeline forecasting · Bottleneck detection · Growth opportunities

Operational Ecosystem

Structure, improve or scale how work gets done across the operation.

For businesses establishing more reliable processes, reducing operational friction or bringing greater control to a complex operation.

The capabilities below are representative examples. Each Operational Ecosystem is composed around the processes, responsibilities and operational requirements that matter to the business — not around a fixed package.

Processes & Workflow

Structure how work moves through the business — connecting steps, responsibilities and systems into controlled operational workflows.

EXAMPLES INCLUDE

Process orchestration · Task routing · Workflow automation · Cross-team handovers · Recurring workflows

Service, Fulfilment & Customer Operations

Coordinate what needs to happen after a customer, order or service request enters the operation — from initial handling through delivery and completion.

EXAMPLES INCLUDE

Customer onboarding · Order processing · Service delivery · Case management · Fulfilment workflows

Workforce, Resources & Field Operations

Coordinate people, capacity and operational resources around the work that needs to be done — across teams, locations and the field.

EXAMPLES INCLUDE

Work scheduling · Capacity planning · Resource allocation · Field dispatch · Work orders

Finance, Procurement & Transactions

Structure the financial, purchasing and transactional processes that keep the operation moving with greater consistency and control.

EXAMPLES INCLUDE

Invoice processing · Reconciliation · Financial approvals · Procurement workflows · Supplier processes

AI, Control & Exceptions

Use AI and automation where work can be handled without intervention, while keeping decisions, exceptions and higher-impact actions within defined controls.

EXAMPLES INCLUDE

Operational AI agents · Intelligent routing · Exception handling · Approval workflows · Human-in-the-loop controls

Operational Intelligence & Optimisation

Make operational performance visible across processes, workloads and exceptions — so the business can identify where attention, intervention or improvement is needed.

EXAMPLES INCLUDE

Process performance · SLA monitoring · Bottleneck detection · Capacity visibility · Optimisation signals

Custom Ecosystem

For requirements that call for a different approach.

Some requirements fall outside a Growth or Operational Ecosystem. A Custom Ecosystem brings together the capabilities needed to address that requirement as one coherent solution.

03 — BUILT AROUND THE BUSINESS

Different requirements call for **different combinations.**

The right solution may bring together systems, workflows, intelligence, AI, integrations and custom software.

What belongs in it depends on what needs to happen, how the business operates and how those parts need to work together.

04 — DELIVERY

Built to **perform in operation**. Not just to go live.

Each solution is designed, built and integrated around the environment in which it needs to operate.

But delivery does not end at launch.

30 days in operation

The first 30 days include monitoring and optimisation to ensure the solution performs as intended in practice.

After the first 30 days

Monitoring and optimisation can continue as an ongoing service. We agree what should be monitored and optimised, and the scope determines the price.
