

MILESTONE 2 — DELIVERY REPORT

Platform Governance & Website Redesign

Backend platform hardening, Supabase reconnection, and a full site restructure to the approved master design specification.

Where things stand

This report covers two connected pieces of work delivered under Milestone 2: the platform governance and reliability work on the client console (organizations, roles, security, notifications, MFA), and a full redesign of the public website to match the approved master design specification — new copy, structure and layout across the Homepage, Foundation, Intelligence, Solutions and Contact pages, in all 10 supported languages.

- **Platform reconnected**

The live database was reconnected and every pending update applied and verified — nothing is running on stale infrastructure.

- **Real official branding**

The site now uses your actual logo and brand color, sampled directly from the provided brand asset — no more placeholder branding.

- **Website fully rebuilt**

Homepage, Foundation, Intelligence, Solutions and Contact pages rebuilt from the ground up to match the approved design specification.

- **Translated everywhere**

All new website copy is live in every one of the 10 supported languages.

- **Security hardened**

Admin and operator accounts now require two-factor verification before they can access anything sensitive.

- **Four real bugs fixed**

Found and fixed during hands-on testing of the live console — issues that would have affected real users signing in.

Platform Governance & Reliability

DONE Live platform reconnected

The production database was reconnected after being unreachable, every pending update applied, and the whole security-permission system verified against the real, live system — not just checked on paper.

DONE Real official branding live

The actual IO SKY logo and brand color (sampled directly from your provided brand file) now appear everywhere across the site and console — replacing the previous placeholder styling.

DONE Two-factor security gate

Admin, super-admin and operator accounts can no longer access sensitive areas of the console without setting up two-factor verification first — tested against a real account, not simulated.

DONE Organization & role management

Super-admins can now create client organizations and assign user roles directly in the console — previously there was no way to do this at all.

DONE Operator role & Security Center

A new, restricted operator role for infrastructure-only staff, plus a dedicated Security Center showing real login activity, security events and two-factor compliance.

DONE Real business intelligence dashboards

Analytics & Insights now shows real numbers — booking-to-deal funnel, top-performing AI Scans — computed from actual activity, not placeholder figures.

DONE Document lifecycle, workflows & integrations

Document versioning and approval, a configurable workflow engine, and an integration/webhook registry are all built and tested.

DONE Notification system

A real, central notification service with a working Notification Center on both the client and admin sides.

DONE Admin console mock data replaced

Every dashboard panel that was previously showing fabricated numbers now shows real data — or is clearly labelled as illustrative where no real data source exists yet.

DONE Email delivery tracking

Every confirmation and notification email sent by the platform is now logged and tracked for delivery success or failure.

DONE

Four real bugs found and fixed

While testing the live console end-to-end: a crash when a certain setting was missing, a broken login redirect, a cookie issue that silently logged users out, and an incorrect security status showing for a verified account.

IN PROGRESS

Third-party integrations (Stripe, Twilio, SendGrid, etc.)

The code is ready to connect these; we're waiting on account credentials from your side before they can go live.

PLANNED

"Invite user" self-service flow

Deliberately held back — this touches how every account signs in platform-wide, and needs a live, hands-on verification pass before it's safe to switch on.

Website Redesign to Master Spec

DONE

Homepage rebuilt

Rebuilt end-to-end to the approved design specification — new structure, new copy, matching the intended reading flow.

DONE

Foundation page rebuilt

Full new copy and layout, replacing the previous version.

DONE

Intelligence page rebuilt

Full new copy and layout, replacing the previous version.

DONE

Solutions page rebuilt

Moved away from a fixed-pricing layout to a flexible capability explorer that matches how you actually scope engagements — Growth, Operational and Custom ecosystems.

DONE

Contact page simplified

Streamlined to a focused, minimal form matching the specification — easier for a visitor to complete, easier for your team to triage.

DONE

Full translation coverage

Every new piece of website copy is live in all 10 supported languages (English, Dutch, German, French, Spanish, Italian, Portuguese, Arabic, Japanese, Chinese). Machine-translated — flagged here as not yet professionally reviewed.

DONE

Real logo & color correction

The real official logo asset now renders everywhere (navigation, footer, browser tab), and the brand orange was corrected to match it exactly.

DONE

Discovery Call & Login reviewed

Checked against the new design language — no conflicting copy or styling found, so these were intentionally left as-is rather than rebuilt unnecessarily.

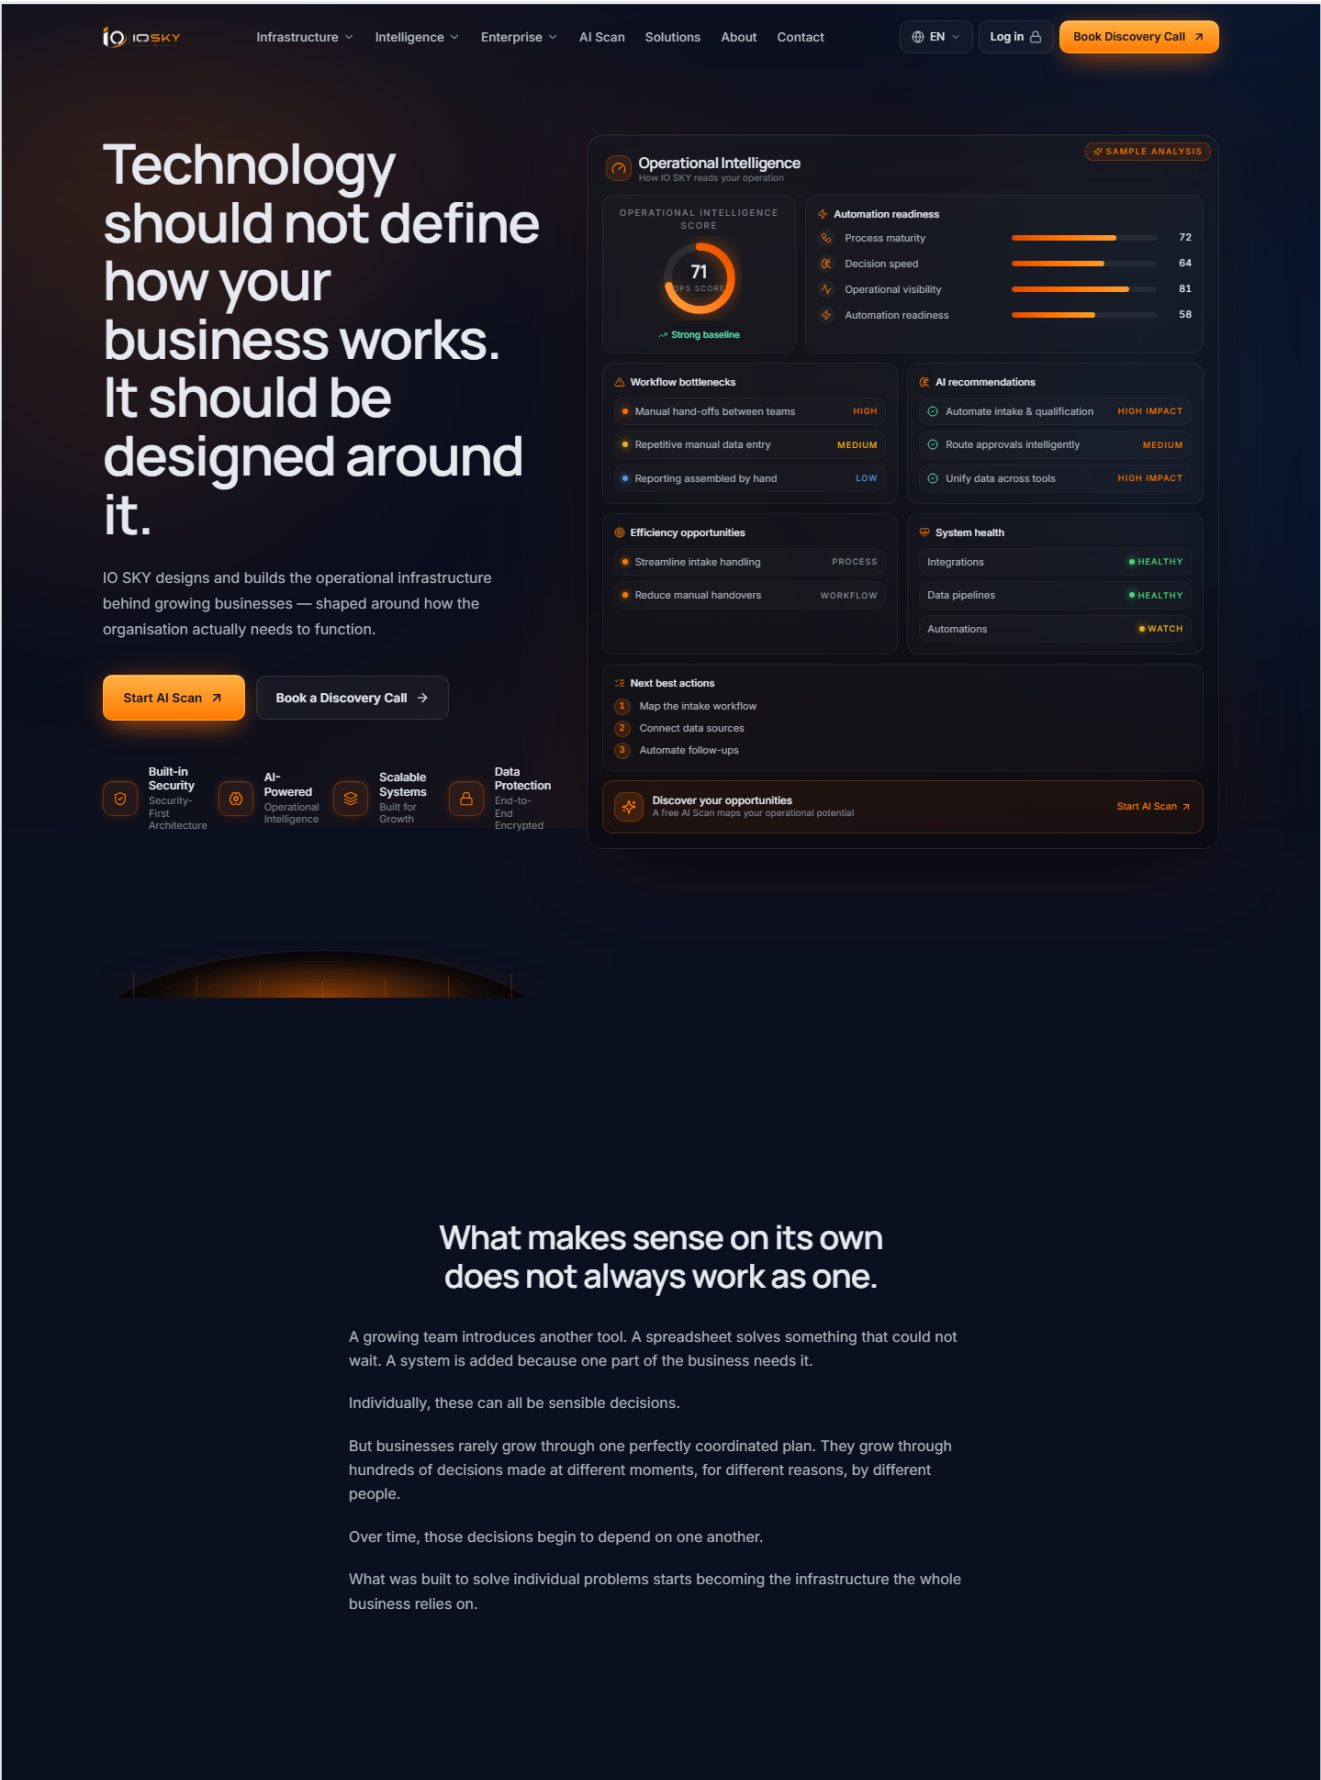

DONE

Verified before shipping

Full automated test suite, type-checking and a production build all passed clean, and every rebuilt page was checked live in a browser before delivery.

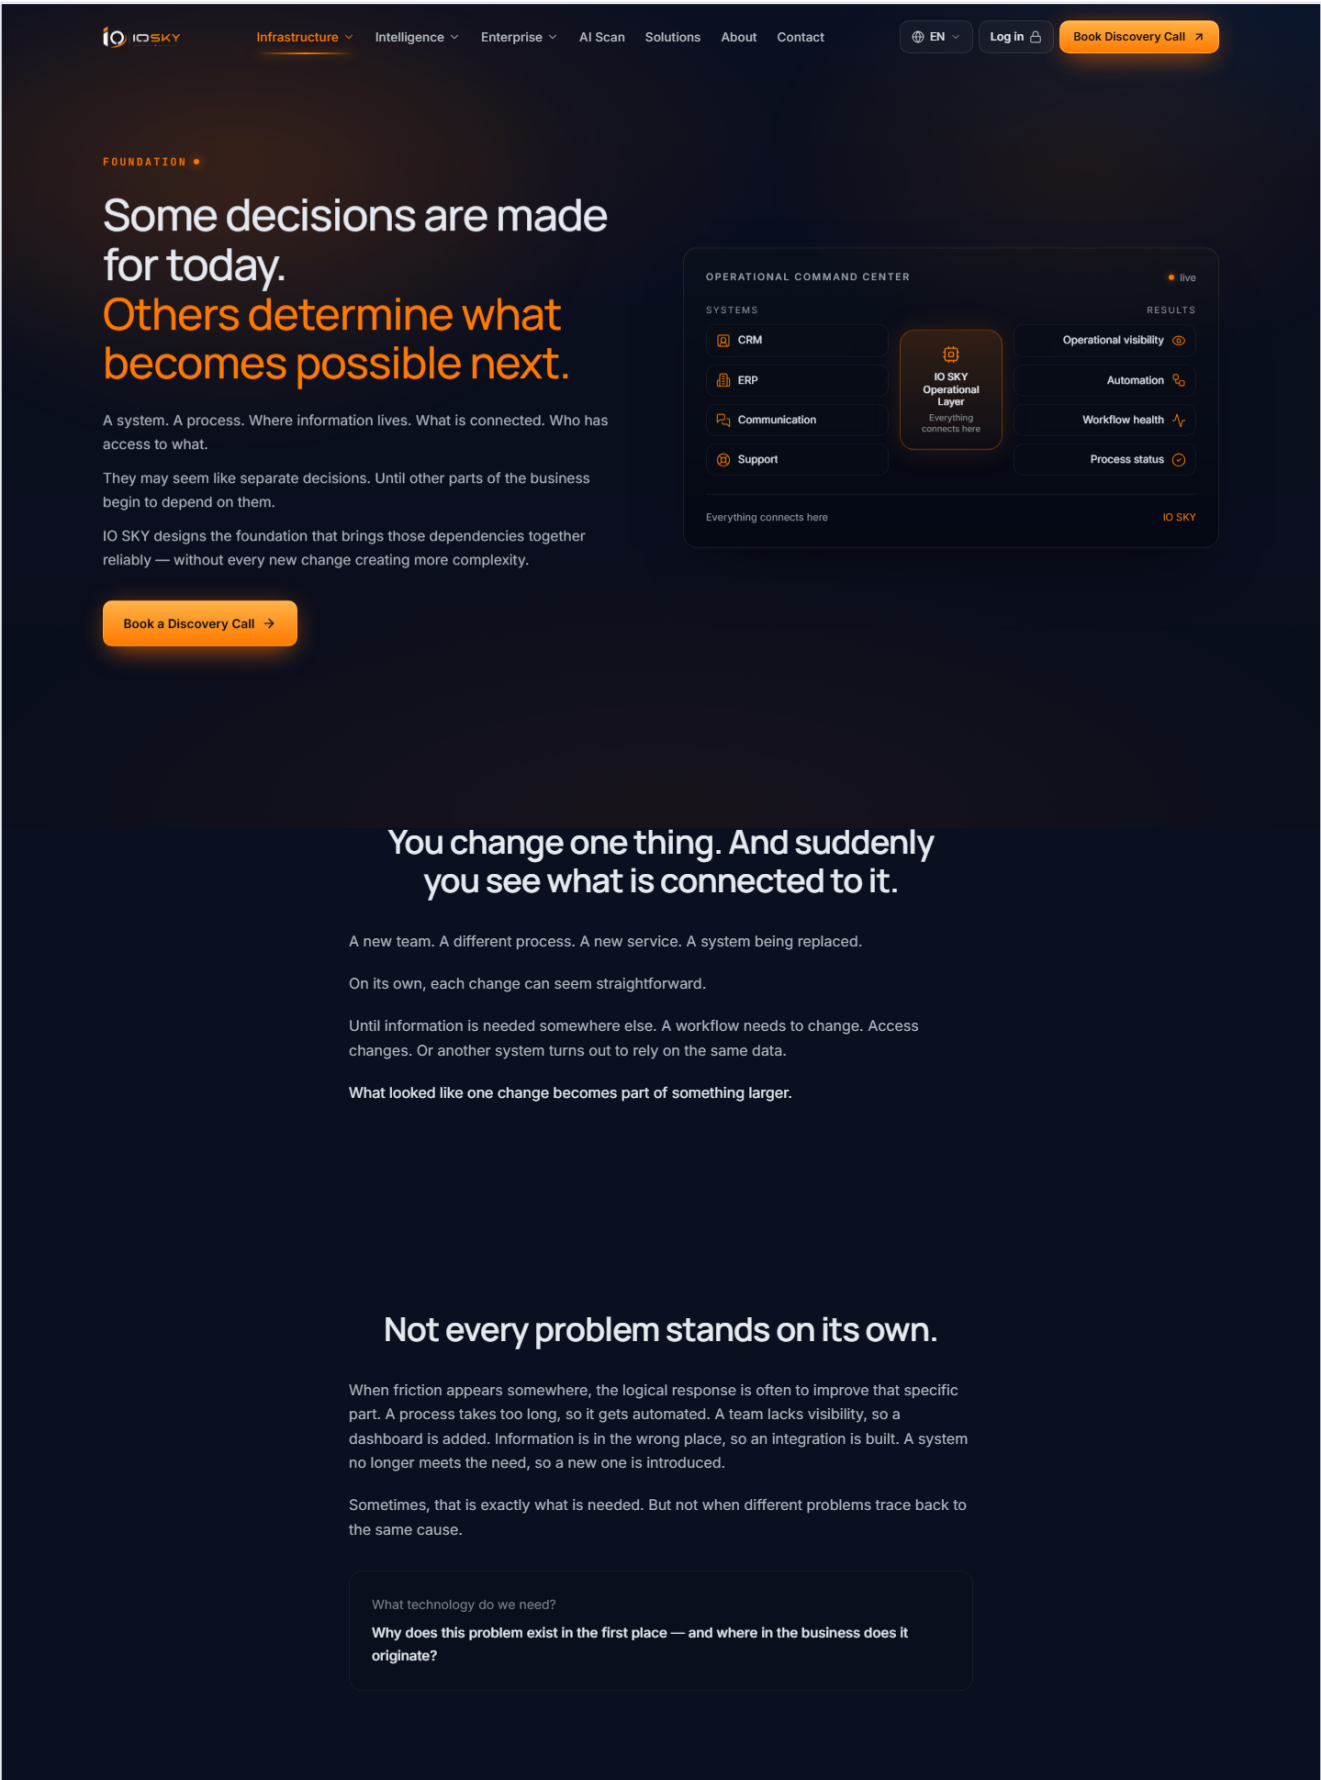

Homepage

The new nine-section homepage flow, matching the approved specification.

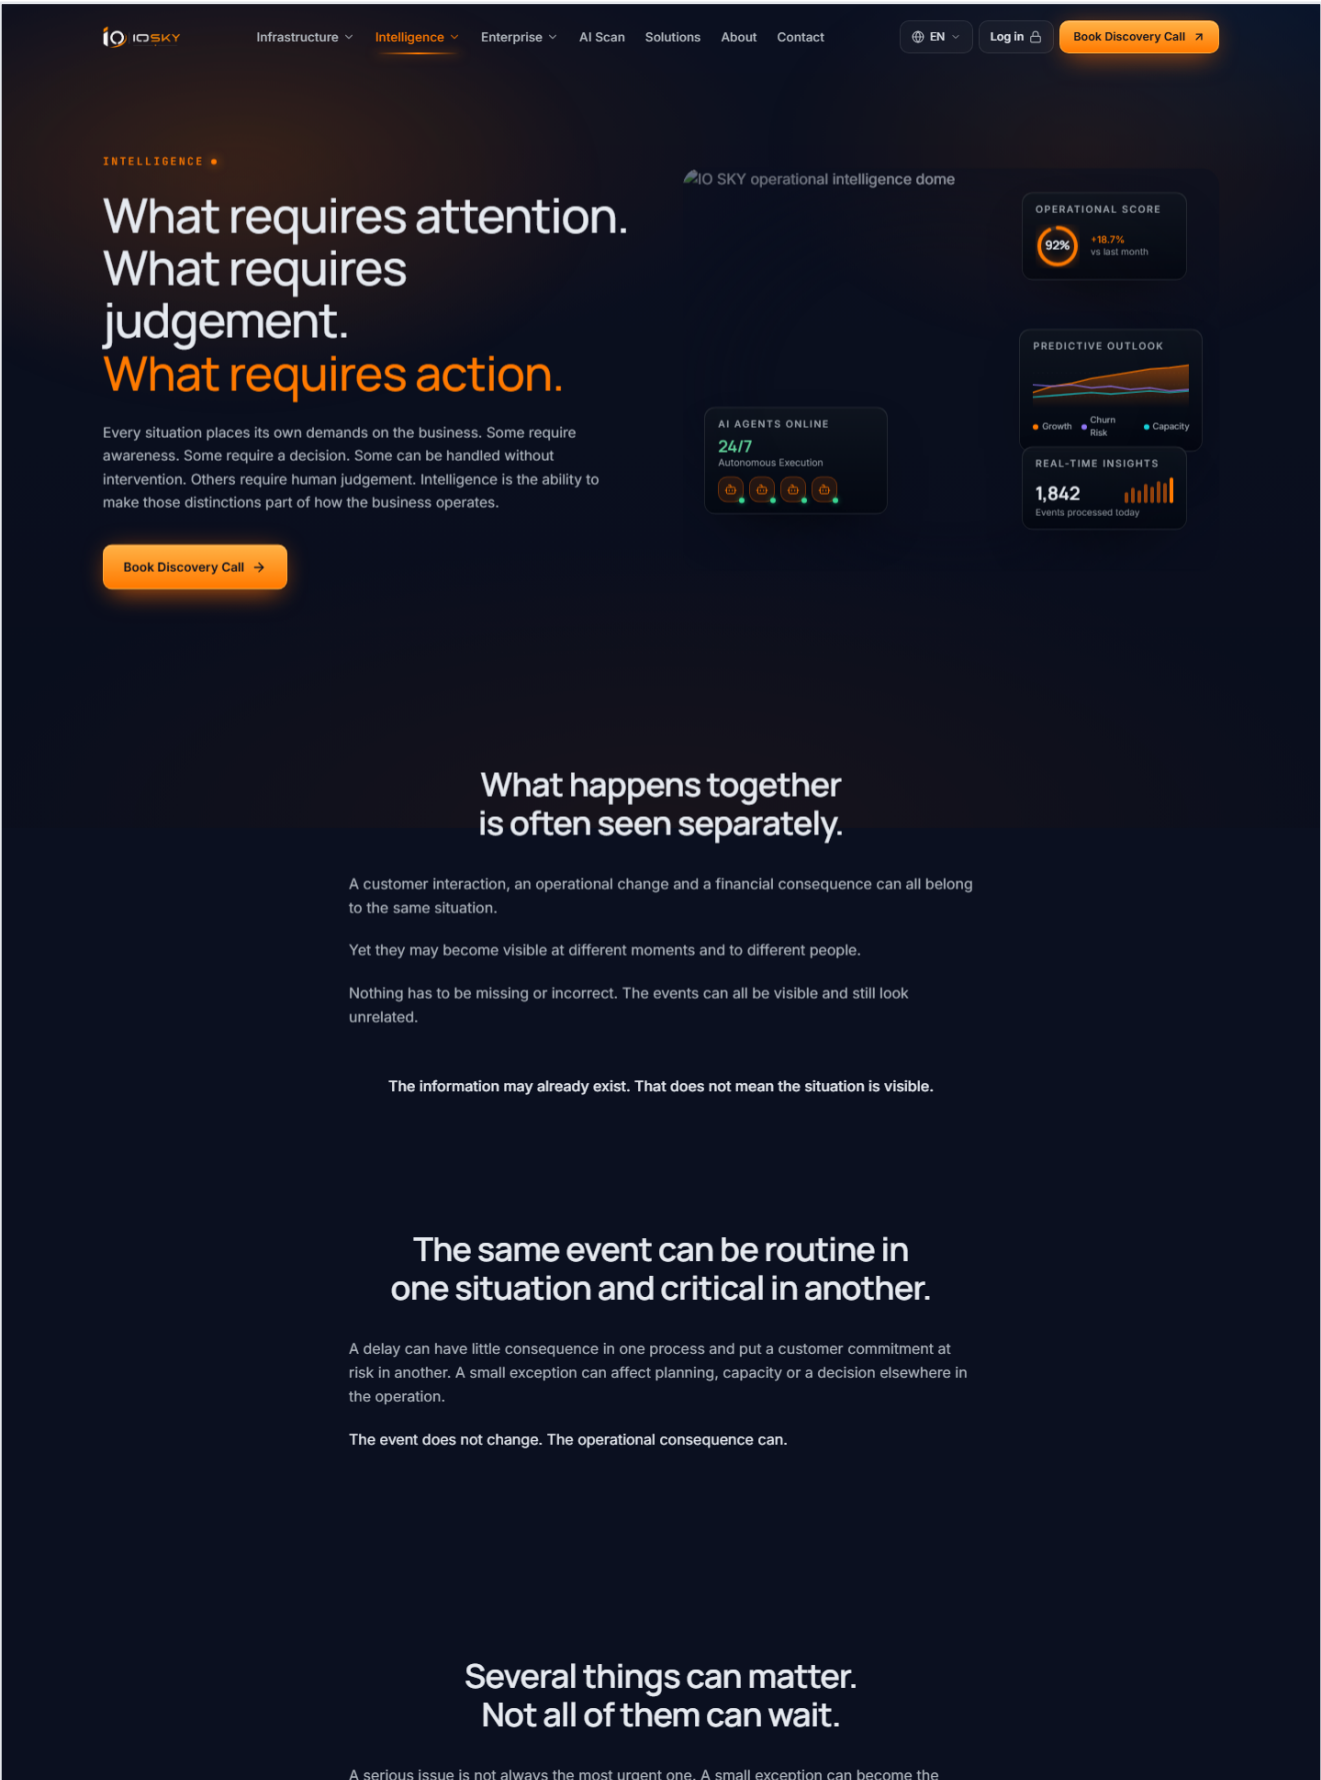

Foundation

Rebuilt copy and structure for the Foundation page.

Intelligence

Rebuilt copy and structure for the Intelligence page.

Solutions

The new capability explorer — Growth, Operational and Custom ecosystems, no fixed pricing tiers.

Start with the business. Build what it requires.

What the business needs to achieve rarely depends on one system or process alone.
IO SKY brings together what the business needs into one coherent solution.

Every solution has a different starting point.

A solution can begin with growth, with the way the business operates, or with a requirement unique to the business.

Growth Ecosystem

Create, structure or strengthen how commercial growth happens.

Operational Ecosystem

Structure, improve or scale how work gets done across the operation.

Custom Ecosystem

Build around a requirement specific to the business.

For businesses building their first repeatable commercial process, scaling what already works or bringing greater control to a complex revenue operation.
Capabilities are composed around the business objective. The examples below illustrate what a Growth Ecosystem can include.

Market & Acquisition

Identify the right markets, accounts and potential customers — and create effective ways to reach and acquire them.

EXAMPLES INCLUDE

Market targeting • Account identification • Buying signals • Demand generation • Acquisition flows

Revenue, Sales & Intelligence

Pipeline & Commercial Processes

Customer Growth

Growth Intelligence & Optimisation

Different requirements call for different combinations.

The right solution may bring together systems, workflows, intelligence, AI, integrations and custom software.

CONTACT

A good conversation begins with understanding what it is about.

Do you have a question, would you like to discuss something with us, or are you contacting us about an existing collaboration? Tell us briefly what it is about. We make sure your message reaches the people who can help you further.

Would you like to explore what could be improved within your organization and what is truly needed for that? Then we prefer to begin with understanding rather than with a solution. For that, a Discovery Call is the right first step.

IO SKY — Milestone 2 Delivery Report

10

What's still open

Third-party accounts

Stripe, Twilio, SendGrid and a production email domain still need credentials from your side before those integrations can go fully live — everything on our end is ready and waiting.

"Invite user" flow

Held back deliberately until it can be verified live, since it touches how every account on the platform signs in.

Professional translation review

The 10-language copy is machine-translated to a high standard, but has not yet had a native-speaker review pass — worth doing before final launch if translation accuracy matters for your markets.

Milestone 3 scope

Ready to start as soon as scope is confirmed.
