IO SKY

AI SCAN OPERATIONAL, ADMINISTRATION & IMPLEMENTATION CLARIFICATION ADDENDUM

Companion Specification to the AI Scan Engine & Universal Assessment System Master Specification v1.0

Developer Review / Freeze Companion v1.0

Proprietary & Confidential

Document Control

Document	AI Scan Operational, Administration & Implementation Clarification Addendum
Version	v1.0
Status	Developer Review / Freeze Companion
Applies to	Operations Scan, Cyber Scan, Elite Scan
Relationship	Supplements the Universal Master Specification; does not replace it
Classification	Proprietary / Confidential

Interpretation: This document contains only supplemental requirements and clarifications that were not sufficiently explicit in the Universal Master. All existing Master requirements remain in force.

Contents

0. Purpose, Authority and Scope
1. Privileged Client, Organisation and Assessment Search
2. Organisation-Centric Internal View
3. Automatic Operational and Financial Administration
4. Tax, VAT and Company Registration Validation
5. Assessment and Report Identification Information
6. Report Architecture, Dynamic Length and Navigation
7. Protected Organisation and Issuer Information
8. Existing Versus New Organisation Handling
9. Reconciliation, Failure Recovery and Duplicate Prevention
10. Assessment Evaluation Engine - No Numerical Scoring Agent
11. Product-Specific Roadmap Labels
12. Executive Briefing Entitlement and Generation Control
13. Reviewer to Super Admin Handoff
14. Super Admin Final Publication Action
15. Scope Boundary: Administration Is Not a Full Accounting Platform
16. Product-Specific Methodologies and Visual Assets to Follow
17. Additional Acceptance Tests
18. Definition of Done for this Addendum
19. Final Implementation Principle

0. Purpose, Authority and Scope

ADD-GEN-001 This Addendum supplements the IO SKY AI Scan Engine & Universal Assessment System Master Specification v1.0. It does not replace the Master Specification.

ADD-GEN-002 Requirements already fully and explicitly defined in the Master Specification are intentionally not repeated here. Their absence from this Addendum does not remove, weaken or supersede them.

ADD-GEN-003 Where this Addendum makes an existing requirement more explicit without changing its intent, the more explicit interpretation applies. A genuine contradiction must be escalated to IO SKY before implementation continues.

ADD-GEN-004 IO SKY specifies required product behaviour, user outcomes, access rules, administrative relationships, security boundaries and acceptance conditions. The development team determines the appropriate engineering implementation, provided the resulting system demonstrably satisfies these requirements.

1. Privileged Client, Organisation and Assessment Search

ADD-SEARCH-001 Global or administrative search for Clients, Organisations or AI Scan Assessments MUST be available only to Super Admin and to an Admin who has been explicitly granted the applicable search/access permission by Super Admin.

ADD-SEARCH-002 Developer, Technical Operator, Client, and a Reviewer acting solely by virtue of reviewer assignment MUST NOT receive global Client, Organisation or Assessment search capability.

ADD-SEARCH-003 Authorised internal search MUST support, at minimum, Organisation Name and Assessment ID.

ADD-SEARCH-004 An authorised user entering an Organisation Name MUST be able to locate the corresponding authorised Organisation record or distinct authorised matches and, after selection, access the Organisation context and its linked AI Scans subject to resource permissions.

ADD-SEARCH-005 An authorised user entering an exact Assessment ID MUST be able to resolve the corresponding authoritative Assessment record and its Organisation relationship, subject to normal backend authorisation.

ADD-SEARCH-006 Assessment ID is a lookup/reference identifier, not an authentication credential or authorisation token. Knowledge of an Assessment ID never grants access.

ADD-SEARCH-007 Reviewer assignment does not grant global search. An assigned Reviewer receives the assigned Assessment only through the controlled Assigned Reviews / My Reviews workflow and the permissions applicable to that assignment.

ADD-SEARCH-008 Unauthorised users MUST NOT discover Clients, Organisations or Assessments through search results, autocomplete, suggestions, partial matches, result counts, recent-search features, API responses, error messages, manipulated URLs, identifier enumeration or indirect metadata disclosure.

ADD-SEARCH-009 For Admin, search permission does not equal unrestricted data permission. After a search result is selected, the platform's normal Role + Permission + Scope + Resource + Assignment/Ownership rules continue to determine what may be viewed or changed.

ADD-SEARCH-010 Where multiple Organisations match a search term, the system MUST present distinct authorised results with sufficient permitted disambiguation information. It MUST NOT guess, automatically merge or select records solely because names are identical or similar.

2. Organisation-Centric Internal View

ADD-ORG-001 The Organisation record MUST provide the central authorised internal context from which Super Admin, or an appropriately permitted Admin, can locate the Organisation's AI Scans without first knowing an Assessment ID.

ADD-ORG-002 All AI Scans associated with an Organisation and visible to the authorised user MUST remain separate historical Assessment records with their own Assessment ID, product, lifecycle state, purchase relationship, snapshot, methodology/configuration version, reviewer, report versions and publication history.

ADD-ORG-003 Each AI Scan summary SHOULD expose, where applicable and authorised: Scan Product, Assessment ID, Purchase/Order reference, Assessment status, Assigned Reviewer, Review status, Customer Publication Language, Primary Audience, Secondary Audience where applicable, entitled deliverables, Executive Briefing status where applicable, Payment status, Publication status, Published Version and Delivered date.

ADD-ORG-004 Where permissions allow, navigation MUST work in both directions: Organisation to AI Scan and AI Scan to Organisation.

ADD-ORG-005 The Organisation view MUST NOT maintain an independent manually duplicated copy of AI Scan, billing, payment, entitlement or publication truth. It represents authoritative platform records.

3. Automatic Operational and Financial Administration

ADD-ADM-001 A successfully processed AI Scan purchase MUST automatically become part of IO SKY's operational and financial administration. Ordinary processing MUST NOT require IO SKY personnel to re-enter the same purchase manually.

ADD-ADM-002 The platform MUST maintain a reconstructable relationship across Client Account, Organisation, Purchase/Order, Billing Record, Payment, Tax Information, Entitlement, AI Scan Product, Assessment ID, Assessment, Reviewer Assignment, Approved Version, Published Version and Deliverables.

ADD-ADM-003 For each AI Scan purchase, authorised internal administration MUST be capable of displaying or reconstructing, where applicable: Client, Organisation, legal/organisation name, country of registration, company registration number, VAT/Tax ID, Scan product, selected add-ons, Purchase/Order reference, Assessment ID, transaction date, net amount, applicable tax treatment/rate, tax amount, gross amount, currency, payment status, relevant payment-provider references, entitlement status and related billing/document reference where applicable.

ADD-ADM-004 The IO SKY platform MUST NOT unnecessarily duplicate sensitive payment credentials or card/bank information held by the payment provider. Retain only information needed for administration, reconciliation, support, audit, entitlement and applicable obligations.

ADD-ADM-005 Administrative processing is lifecycle-driven, not purchase-only. Relevant administrative views MUST reflect authoritative changes in payment, entitlement, assessment, review, publication and Executive Briefing state without duplicate manual entry.

ADD-ADM-006 Payment status, Entitlement status, Assessment status, Expert Review status, Publication status and Executive Briefing status where applicable MUST remain distinguishable; they MUST NOT be collapsed into one generic Completed status.

ADD-ADM-007 Administrative display fields MUST NOT provide an alternative path to bypass controlled workflow. An administrative field cannot be used to force Paid, Review Complete, Published or Executive Briefing Ready without the authoritative workflow event that establishes that state.

4. Tax, VAT and Company Registration Validation

ADD-TAX-001 The production payment/tax architecture MUST determine applicable VAT/tax treatment at checkout using the configured production tax rules, customer information and supported validation mechanisms.

ADD-TAX-002 The completed transaction record MUST preserve sufficient tax information to reconstruct the financial transaction, including where applicable net amount, tax treatment/rate, tax amount, gross amount and currency.

ADD-TAX-003 An authorised Super Admin, and an Admin with the relevant billing/organisation permissions, MUST be able to view applicable transaction tax information and the supplied VAT/Tax ID and relevant validation status where applicable.

ADD-TAX-004 Company Registration Number validation and VAT/Tax ID validation are separate processes. One MUST NOT be treated as proof of the other.

ADD-TAX-005 Company-registration handling MUST be country-aware. For Netherlands-registered organisations, the production implementation MUST use an appropriate approved Dutch company-registration/KVK validation mechanism where available. For organisations registered elsewhere, the implementation MUST support the

appropriate registration identifier and validation approach for each supported country rather than assuming a Dutch KVK number.

ADD-TAX-006 For supported countries, the development team MUST document the identifier type, expected format, approved validation source/provider where available, real-time or non-real-time behaviour, provider-unavailable behaviour, failed-validation behaviour, mismatch behaviour, fallback behaviour and stored validation status.

ADD-TAX-007 The platform MUST support the semantic equivalent of Verified, Not Verified, Verification Pending, Verification Unavailable and Mismatch / Requires Review. Internal enum names may differ.

ADD-TAX-008 AI MUST NOT silently alter authoritative company-registration or VAT/Tax master data because an external validation result or assessment answer suggests another value. A mismatch may be flagged for authorised review.

ADD-TAX-009 Organisation Master Tax Data and Transaction Tax Snapshot are separate. Later changes to current VAT/Tax information MUST NOT silently rewrite a completed historical transaction.

5. Assessment and Report Identification Information

ADD-INFO-001 The Report Information section MUST contain the assessed Organisation's Legal / Organisation Name, Country of Registration and Company Registration Number where applicable.

ADD-INFO-002 The assessed Organisation's VAT/Tax ID MUST NOT be printed in the customer-facing Assessment Report merely because it exists in billing or Organisation administration. It remains available only where authorised for operational/financial purposes unless IO SKY later approves a specific reporting requirement.

ADD-INFO-003 The Report Information section MUST also contain Assessment ID, Scan Product, Report Version, Delivered Date and other already-required report traceability information from the Master Specification.

ADD-INFO-004 For clarity, Report Version means the immutable version identifier of the approved/published report artefact, for example Published v1, Published v2 or an equivalent controlled version label. It identifies which exact report version was delivered; it is not a customer score, publication date or methodology version.

ADD-INFO-005 The Report Information section MUST contain approved IO SKY issuer information, including IO SKY's registered/trading business name, applicable KVK/company registration number and approved contact information. These values MUST come from centrally configured authoritative issuer data and MUST NOT be invented by AI.

ADD-INFO-006 The report cover MUST remain a separate, minimal single-page cover. It MUST NOT be expanded into a company-information page. The cover remains governed by the Master: IO SKY branding/logo, Scan Type, Organisation Name, Assessment Report, Delivered date and Confidential, using the approved minimal premium composition.

ADD-INFO-007 Report Information MUST be a distinct report section/page following the cover. Contents MUST be a distinct subsequent section/page. Detailed company/issuer identification information belongs in Report Information, not on the minimal cover.

ADD-INFO-008 IO SKY will separately provide and approve the final visual reference compositions/design assets for the report system. Development MUST NOT interpret this Addendum as approval to invent a final visual design that bypasses the required IO SKY visual approval gate.

6. Report Architecture, Dynamic Length and Navigation

ADD-RPT-001 The number 21 in the Master Specification refers to the 21 required report sections/chapters. It does NOT mean that a report must contain exactly 21 physical pages.

ADD-RPT-002 Operations Scan, Cyber Scan and Elite Scan use the same universal 21-section narrative architecture unless a later approved product-specific specification explicitly changes a product requirement.

ADD-RPT-003 Final report length MUST be content-driven. A section may occupy part of a page, one page, multiple pages, multiple spreads or continuation pages according to the approved assessment content and report composition rules.

ADD-RPT-004 Operations, Cyber and Elite reports MAY and are expected to differ in final page count because their scope, domain coverage, findings, relationships, risks, recommendations, roadmap content and explanatory depth may differ.

ADD-RPT-005 There is no universal requirement that the three Scan products produce reports of equal length, and there is no fixed universal page count unless IO SKY later approves one.

ADD-RPT-006 The system MUST NOT omit, merge, truncate, compress or weaken substantively relevant approved content merely to reach a predetermined page count. Pagination is a rendering outcome, not an assessment objective.

ADD-RPT-007 The Contents section MUST display the actual final chapter/page destinations after pagination. Selecting a Contents entry in the downloadable PDF MUST navigate directly to the correct corresponding section/page.

ADD-RPT-008 The downloadable PDF MUST contain functional internal hyperlinks and a document outline/bookmark structure for the required report navigation. Internal destinations MUST be resolved against the final generated pagination.

ADD-RPT-009 The Client Portal digital-book experience MUST provide equivalent section navigation appropriate to the portal interface, including direct navigation from Contents/chapter navigation to the relevant report section.

ADD-RPT-010 Broken, missing or incorrectly targeted internal links/bookmarks constitute report-generation QA failure and MUST prevent the affected report version from being treated as publication-ready.

7. Protected Organisation and Issuer Information

ADD-SEC-001 Customer-specific registration, tax, billing, assessment and administrative information MUST be protected under the platform's tenant-isolation, least-authorised-access and backend authorisation model, regardless of whether an individual company-registration datum may also be publicly obtainable elsewhere.

ADD-SEC-002 AI components MUST receive only information required for the authorised assessment, review, report or deliverable task.

ADD-SEC-003 AI MUST NOT expose, reproduce, transfer or leak one customer's Organisation, registration, VAT/tax, billing, assessment or administrative information to another customer, Organisation, assessment or unauthorised internal user.

ADD-SEC-004 Customer A information MUST NOT appear in Customer B's assessment conversation, generated questions, findings, report, PDF, Executive Briefing, reviewer workspace, search results, administrative views or AI-generated output.

ADD-SEC-005 The same access and leakage protections apply to non-public or controlled IO SKY issuer/administrative information.

ADD-SEC-006 AI MUST NOT invent company-registration numbers, VAT IDs, legal entity information, issuer information or validation results. Where authoritative information is unavailable, the system MUST represent it as unavailable, incomplete or requiring validation.

ADD-SEC-007 Published reports MUST bind Organisation and IO SKY issuer information to the applicable approved/published report version. Subsequent master-data changes MUST NOT silently mutate an already approved or published report.

8. Existing Versus New Organisation Handling

ADD-ORG-006 Where an authenticated existing Client purchases a new Scan for an existing Organisation, the new Purchase, Entitlement and Assessment MUST be associated with that existing Organisation rather than creating a duplicate Organisation.

ADD-ORG-007 Where the purchase genuinely relates to a new Organisation, the approved purchase/account flow may create the required new Organisation relationship.

ADD-ORG-008 Organisations MUST NOT be automatically merged solely because names are identical or similar. Matching and merge behaviour must respect authenticated context, reliable identifiers, security and authorised review.

9. Reconciliation, Failure Recovery and Duplicate Prevention

ADD-REC-001 An authorised internal user MUST be able to reconstruct the relationship Organisation to Purchase to Payment to Billing Record to Tax to Product/Add-ons to Assessment ID to Entitlement.

ADD-REC-002 The platform MUST preserve sufficient relevant payment-provider references to reconcile an IO SKY administrative record with its underlying payment transaction.

ADD-REC-003 If payment is authoritatively confirmed but downstream administrative processing fails, the payment remains confirmed. The customer MUST NOT be charged again merely because administrative processing requires retry or recovery.

ADD-REC-004 Retrying downstream administrative processing MUST NOT initiate a second charge.

ADD-REC-005 Retries, duplicate webhooks, browser refreshes and recovery operations MUST NOT create duplicate logical Purchases/Orders, administrative payment records for the same logical transaction, Assessments, Assessment IDs, Entitlements, Organisations or billing records.

10. Assessment Evaluation Engine - No Numerical Scoring Agent

ADD-EVAL-001 The AI Scan architecture MUST NOT implement a customer or Organisation Numerical Scoring Agent unless IO SKY separately approves a future product change. The required concept is an Assessment Evaluation Engine.

ADD-EVAL-002 The Assessment Evaluation Engine may evaluate structured factors including Evidence, Confidence, Impact, Urgency, Dependencies, Risk/Opportunity, Decision Relevance, Priority and Recommendation Proportionality.

ADD-EVAL-003 The Evaluation Engine MUST NOT convert those factors into an arbitrary overall company score, maturity score, readiness score, health score, AI-readiness percentage, confidence percentage, priority score or assessment score.

ADD-EVAL-004 The purpose of evaluation is to support defensible Findings, Confidence, Priority, Recommendations, Decision Considerations and Roadmap sequencing, not to grade the Organisation.

11. Product-Specific Roadmap Labels

ADD-RDM-001 Operations Scan customer-facing roadmap deliverable: Priority Roadmap.

ADD-RDM-002 Cyber Scan customer-facing roadmap deliverable: Security Roadmap.

ADD-RDM-003 Elite Scan customer-facing roadmap deliverable: Strategic Priority Roadmap.

ADD-RDM-004 These labels do not create three separate roadmap engines. The universal roadmap behaviour remains shared; the applicable product-specific methodology determines substantive content.

12. Executive Briefing Entitlement and Generation Control

ADD-EB-001 Where Executive Briefing is an optional add-on, the customer MUST explicitly select it during purchase configuration. It MUST NOT be preselected.

ADD-EB-002 Selection in the interface alone is not entitlement. Successful authoritative purchase/payment confirmation MUST result in an Executive Briefing Entitlement before generation can ever become eligible.

ADD-EB-003 The system MUST NOT create, queue, initiate or execute an Executive Briefing generation job unless the Assessment's authoritative Entitlement explicitly includes Executive Briefing. This prohibition applies to both automated and manual generation paths.

ADD-EB-004 Under the current commercial configuration: Operations without the Executive Briefing add-on produces no Executive Briefing; Cyber without the add-on produces no Executive Briefing; Elite without the Executive Briefing add-on produces no Executive Briefing. Elite's included Live Expert Review does not create Executive Briefing entitlement.

ADD-EB-005 Payment confirmation creates entitlement; it does NOT trigger immediate Executive Briefing generation.

ADD-EB-006 Final Executive Briefing generation becomes eligible only after Executive Briefing entitlement exists and the applicable canonical report has completed required analysis, Expert Review and approval, with no blocking version/content condition.

ADD-EB-007 Required trigger chain: explicit customer selection -> successful payment confirmation -> Executive Briefing Entitlement -> assessment completion -> analysis completion -> Expert Review completion -> canonical report approval -> briefing generation eligible -> generation from that approved version -> briefing QA -> publication-ready.

ADD-EB-008 The system MUST NOT pre-generate Executive Briefings for customers who did not purchase them, and MUST NOT initiate provider calls or generation costs for an unentitled Assessment.

ADD-EB-009 Every Executive Briefing MUST be bound to the specific approved canonical report version from which it was generated. A material change to that source version invalidates affected Briefing output until controlled regeneration/revalidation.

ADD-EB-010 Executive Briefing remains a professional audiovisual executive presentation with professional voice-over, controlled IO SKY visual language, meaningful animation/motion, narrative structure, report-derived visualisation, content/language/version QA, and customer-language alignment. It MUST NOT become a generic slideshow, raw text-to-speech output or animated PDF read-aloud.

13. Reviewer to Super Admin Handoff

ADD-REV-001 After completing Expert Review, the assigned Reviewer MUST have an explicit action equivalent to Approve & Send to Super Admin.

ADD-REV-002 This action MUST run the Review Completion Gate before progression.

ADD-REV-003 A successful handoff MUST preserve the approved review revision, Reviewer identity, completion timestamp, Reviewer Handoff Summary, Reviewer Notes intended for Super Admin, material change summary, remaining limitations/non-blocking attention points where applicable, customer publication language, audiences, entitled deliverables and applicable version references.

ADD-REV-004 Reviewer Notes intended for Super Admin MUST travel with the approval/handoff and remain visible during Super Admin publication review.

ADD-REV-005 After successful handoff, the Assessment enters the semantic state Approved - Awaiting Publication Review, or an equivalent internally named state with the same business meaning.

ADD-REV-006 Successful handoff MUST create the corresponding Super Admin publication-review task/attention state.

14. Super Admin Final Publication Action

ADD-PUB-001 Before publication, Super Admin MUST be able to inspect the approved publication package and relevant Reviewer handoff information.

ADD-PUB-002 The final publication action MUST be a deliberate Super Admin action equivalent to Publish Assessment.

ADD-PUB-003 Reviewer approval MUST NOT automatically publish the Assessment to the customer.

ADD-PUB-004 After all publication gates pass, Publish Assessment is the controlled final publication action for the authorised publication package; Super Admin SHOULD NOT be required to publish every entitled component separately.

ADD-PUB-005 Depending on product and entitlement, the publication package may contain the Assessment Report, Executive Summary, applicable Priority/Security/Strategic Priority Roadmap, downloadable PDF, Client Portal publication, publication metadata, Executive Briefing only where entitled and publication-ready, and the resulting customer notification state.

ADD-PUB-006 Publication MUST NOT expose a deliverable the customer did not purchase or otherwise validly receive.

15. Scope Boundary: Administration Is Not a Full Accounting Platform

ADD-SCOPE-001 The IO SKY platform MUST contain sufficient operational and financial information for Organisation administration, AI Scan administration, payment/tax visibility, reconciliation, entitlement, operational support, audit and traceability.

ADD-SCOPE-002 These requirements do not by themselves require the development team to reproduce a complete external bookkeeping/accounting platform inside IO SKY. Any future accounting-system integration may be specified separately.

16. Product-Specific Methodologies and Visual Assets to Follow

ADD-FUT-001 IO SKY will separately provide the Operations Scan methodology/domain specification, Cyber Scan methodology/domain specification and Elite Scan methodology/domain specification. These will define the product-specific domains, investigation objectives, controlled question/domain libraries, triggers and product-specific assessment content within the Universal Engine.

ADD-FUT-002 The development team MUST NOT treat the absence of those separate methodology documents in this Addendum as permission to invent or freeze the final Operations, Cyber or Elite assessment methodology.

ADD-FUT-003 IO SKY will separately provide/approve the mandatory report visual reference compositions and final design direction before exact report design tokens are frozen.

17. Additional Acceptance Tests

ID	Scenario	Required Result
ADD-TST-001	Super Admin searches Organisation Name and can locate the authorised Organisation and associated AI Scans.	PASS
ADD-TST-002	Super Admin searches exact Assessment ID and reaches the correct authoritative Assessment.	PASS
ADD-TST-003	Admin without explicit search permission attempts Client/Organisation/Assessment search.	DENIED / NO DISCLOSURE
ADD-TST-004	Developer or Technical Operator attempts global Client/Organisation/Assessment search.	DENIED / NO DISCLOSURE
ADD-TST-005	Assigned Reviewer accesses assigned Assessment through My Reviews, then attempts global Organisation search.	ASSIGNED ACCESS PASS; GLOBAL SEARCH FAIL
ADD-TST-006	Organisation with multiple Scans displays distinct Assessment IDs, products and lifecycle states.	PASS

ID	Scenario	Required Result
ADD-TST-007	Successful purchase creates/updates required administrative relationships without duplicate manual entry.	PASS
ADD-TST-008	Authorised internal user can inspect transaction/tax information and VAT/Tax data where operationally authorised.	PASS
ADD-TST-009	Downstream administrative failure occurs after confirmed payment.	PAYMENT REMAINS CONFIRMED; NO SECOND CHARGE; RECOVERABLE
ADD-TST-010	Same payment/webhook event is replayed.	NO DUPLICATE PURCHASE / ASSESSMENT / ID / ENTITLEMENT / BILLING RECORD
ADD-TST-011	Current Organisation VAT/Tax data changes after a completed transaction.	HISTORICAL TRANSACTION SNAPSHOT UNCHANGED
ADD-TST-012	Customer buys Scan without Executive Briefing.	NO BRIEFING JOB / QUEUE / PROVIDER GENERATION CALL
ADD-TST-013	Customer selects Executive Briefing but authoritative payment is not completed.	NO ENTITLEMENT; NO GENERATION
ADD-TST-014	Executive Briefing is paid but canonical report is not yet approved.	ENTITLEMENT EXISTS; GENERATION DOES NOT START
ADD-TST-015	Entitled Executive Briefing reaches approved canonical report state.	GENERATION MAY START AGAINST CORRECT APPROVED VERSION
ADD-TST-016	Material source-report change occurs after Briefing generation.	OLD BRIEFING BLOCKED UNTIL CONTROLLED REGENERATION/REVALIDATION
ADD-TST-017	Reviewer selects Approve & Send to Super Admin.	GATE RUNS; NOTES/HANDOFF PRESERVED; SUPER ADMIN TASK CREATED
ADD-TST-018	Reviewer attempts customer publication.	FAIL
ADD-TST-019	Super Admin reviews valid package and selects Publish Assessment.	CORRECT ENTITLED PACKAGE PUBLISHED TO CORRECT CUSTOMER
ADD-TST-020	Operations/Cyber/Elite roadmap labels are rendered.	PRIORITY / SECURITY / STRATEGIC PRIORITY ROADMAP
ADD-TST-021	Generated PDF Contents links and bookmarks are checked after final pagination.	EVERY TARGET RESOLVES CORRECTLY
ADD-TST-022	A long assessment produces more than 21 pages.	NO TRUNCATION OR FORCED COMPRESSION
ADD-TST-023	Multiple isolated Organisations contain distinct registration/tax data; assessment/report/PDF/Briefing generation is executed.	NO CROSS-TENANT DATA LEAKAGE
ADD-TST-024	Published report is retained while Organisation or IO SKY issuer master data later changes.	PUBLISHED VERSION REMAINS HISTORICALLY IMMUTABLE

18. Definition of Done for this Addendum

1. Organisation and Assessment search is restricted to Super Admin and explicitly authorised Admin.

2. Assessment ID lookup follows the same privilege boundary and never functions as authorisation.

3. Developers and Technical Operators cannot globally discover customers or assessments; assigned Reviewers receive assigned work only.

4. Organisation context exposes separate AI Scan history and authoritative linked records.

5. AI Scan purchase and lifecycle events are automatically reflected in operational/financial administration without duplicate manual entry.

6. Country-aware company-registration validation and separate VAT/Tax validation are supported and documented.

7. Customer-facing Report Information includes the approved organisation identification fields, while customer VAT/Tax ID is not printed by default.

8. IO SKY issuer identity, KVK/company registration number and approved contact information are sourced from authoritative configuration.

9. The cover remains a minimal single page; Report Information and Contents remain separate subsequent sections.

10. The 21-section architecture is never interpreted as a fixed 21-page limit.

11. PDF Contents links/bookmarks and Portal chapter navigation resolve to the correct final destinations.

12. Protected customer and IO SKY data cannot leak across tenants, assessments, users or AI-generated deliverables.

13. No numerical Scoring Agent is introduced.

14. Product-specific roadmap labels are enforced.

15. Executive Briefing generation is impossible without authoritative entitlement and cannot begin before the approved canonical report is eligible.

16. Reviewer approval carries the handoff notes/package to Super Admin and cannot publish.

17. Super Admin controls final publication through the explicit Publish Assessment action.

18. All applicable additional acceptance tests pass.

19. Final Implementation Principle

The purpose of this Addendum is to remove operational ambiguity without dictating the development team's internal engineering design. The final implementation must allow IO SKY to move securely and traceably from Customer / Organisation to Purchase, Payment & Tax, Entitlement, Assessment, Intelligent Analysis, Expert Review, Super Admin Publication Review, Secure Publication and Administration without duplicate manual administration, uncontrolled search access, incorrect customer binding, cross-tenant information leakage, unentitled deliverable generation, forced report page counts or ambiguity about the authoritative state of an AI Scan.

Controlled dependencies: IO SKY will separately provide the Operations, Cyber and Elite product-specific methodology/domain specifications and will separately approve the mandatory visual report reference compositions before final design-token freeze.
