IO SKY AI SCAN

REPORT DESIGN SYSTEM, TEMPLATE ARCHITECTURE & VISUAL CONSISTENCY SPECIFICATION

Developer Implementation Specification

Applies to: Operations Scan · Cyber Scan · Elite Scan

Version 1.0 · Proprietary & Confidential

Design principle

The assessment changes the intelligence and content - not the identity or design of the report.

This document freezes the universal report architecture, visual-system boundaries, AI design boundary and acceptance criteria. Exact production typography remains subject to the explicit approval gate defined herein.

1. Purpose

This specification defines the mandatory visual architecture and rendering behaviour of all customer-facing IO SKY AI Scan Reports.

The objective is to establish **one controlled, recognisable and repeatable IO SKY Report System**. Every Operations Scan, Cyber Scan and Elite Scan Report must visibly belong to the same report family.

Different customers must **not** receive reports that appear to have been independently designed by AI. The assessment determines the substance of the report. The IO SKY Report System determines its presentation.

Customer reports may differ in content. They must not arbitrarily differ in design.

Dynamic differences may include findings, strengths, risks, recommendations, relationships, roadmap content, section length and total page count. They must not include arbitrary differences in typography, colours, margins, header/footer design, section architecture, visual styling or component behaviour.

2. Design Authority

The approved visual reference images supplied by IO SKY are mandatory implementation references. The initial reference set consists of: **Cover Reference**, **Report Contents Reference**, and **Key Findings Reference**.

Together these establish the required visual language, including visual hierarchy, whitespace, colour balance, typography direction, information density, header and footer treatment, Orange usage, editorial presentation, component restraint and overall quality.

The remaining sections do not need to use the exact physical composition of the Key Findings page. Their layouts must support their respective content while remaining unmistakably part of the same IO SKY design system.

The required character is: **Calm. Controlled. Premium. Minimal. Executive. Architectural.**

The report must not resemble a generic AI report, SaaS dashboard, questionnaire result, infographic or presentation deck.

3. One Universal Report Design System

Operations, Cyber and Elite must use **one universal visual report system**. A customer receiving an Operations Scan and another customer receiving an Elite Scan should immediately recognise both documents as IO SKY reports.

The following remain visually consistent across customers and Scan products: design language; page architecture; typography system; colour system; margins; grid; spacing logic; header; footer; chapter presentation; component styling; finding presentation; recommendation presentation; roadmap visual language; navigation; hyperlink treatment; page numbering; confidentiality treatment.

The product type does not create a separate visual design system. Operations, Cyber and Elite differ primarily through their assessment methodology and resulting content.

4. Fixed 21-Section Report Architecture

The following **21 report sections are fixed as the universal report architecture**:

01 - Cover
02 - Report Information
03 - Contents
04 - Executive Summary
05 - Assessment Context
06 - Assessment Scope
07 - Current Position

08 - Strengths to Preserve
09 - Key Findings
10 - Detailed Assessment
11 - Connected Insights
12 - Risks, Constraints & Opportunities
13 - Priority Framework
14 - Recommended Actions
15 - Decision & Investment Considerations
16 - Roadmap
17 - What to Preserve
18 - Further Investigation
19 - Recommended Next Steps
20 - Assessment Methodology & Limitations
21 - Closing Page

These section identities and their order are system-controlled. AI must not independently rename chapters, reorder chapters, invent additional primary chapters, omit required chapters because little content exists, merge chapters merely to shorten a report, or redesign the report architecture for an individual customer.

A future change to the universal section architecture requires explicit IO SKY approval and a controlled specification/version update.

5. Product-Specific Roadmap Naming

Section 16 uses the applicable customer-facing roadmap name: **Operations Scan - Priority Roadmap**; **Cyber Scan - Security Roadmap**; **Elite Scan - Strategic Priority Roadmap**.

This does not create three different visual report architectures. The underlying report system remains universal.

6. Sections Are Not Pages

The 21-section architecture must never be interpreted as a 21-page requirement. Sections and physical pages are different concepts.

A section may occupy part of a page where appropriate, one complete page, multiple pages, multiple spreads or continuation pages. Final report length is determined by approved content.

Operations, Cyber and Elite reports may have different page counts, and two reports of the same product may also differ in length. What changes is the amount of content, not the design system.

The system must never remove, weaken, shrink or compress relevant content merely to reach a predetermined page count.

7. Standard Page Architecture

Standard report pages use **A4 portrait**. The general structure is: **Deep Teal Header -> Off-White Report Canvas -> Structured Editorial Content -> Minimal Footer**.

The Cover is an exception and uses its separately approved full-page composition. Continuation pages remain within the same visual system.

8. Colour System

Principal report colours: **IO SKY Deep Teal #0D2D2E**; **IO SKY Orange #F58A1F**; **approved warm Off-White report canvas**.

Deep Teal is the dominant information colour. Off-White is the primary reading surface. Orange is a controlled functional accent.

Grey typography must not become the default method for creating hierarchy. Hierarchy should instead be created through typography, size, weight, spacing, Deep Teal, controlled Orange and positioning.

9. Mandatory Orange Usage Rule

Orange communicates navigation, reference, interaction and controlled emphasis. It does not decorate the report.

Approved uses include chapter/section numbers; FINDING 01 and equivalent reference labels; bullet markers where appropriate; internal hyperlinks; cross-references; selected navigation; restrained functional accent lines; and other specifically approved reference/interaction states.

Orange must not be applied indiscriminately to body paragraphs, entire headings without purpose, arbitrary words, large backgrounds, large cards, decorative surfaces, excessive borders, unnecessary icons or visual effects used only to attract attention.

The approved Key Findings reference establishes the target balance. Developers must not increase Orange usage merely to make a page appear more branded.

10. Typography Direction

The typography demonstrated in the approved visual references defines the required **visual direction**, but the exact production typography is not yet frozen.

The typography must feel modern, clean, highly legible, executive, premium, professional and restrained.

The hierarchy must clearly distinguish: **Chapter Number -> Chapter Title -> Primary Content/Finding Title -> Subheading -> Body Copy -> Supporting Metadata / Labels**.

Typography must never be reduced excessively to force content onto a page. Whitespace and continuation pages take precedence over content compression.

11. Mandatory Typography Approval Gate

Before typography becomes production-frozen, the development team must implement and provide IO SKY with a **real production-rendered reference** using the proposed typography system.

It must demonstrate at minimum: chapter number; chapter title; major content heading; secondary heading; body text; metadata; labels; internal hyperlink; multi-line content; header; footer.

Until explicit IO SKY approval, the exact font family, font weights, font sizes, line heights, letter spacing and final typography tokens are **not frozen**.

After approval, those values become controlled, versioned report-design tokens and must be used consistently throughout the report system.

12. Header

Standard report content pages use the approved Deep Teal header. **Left:** official IO SKY logo. **Right:** Scan Product and Organisation Name.

The supplied official IO SKY logo must be used as an actual production asset. It must not be regenerated, redrawn, approximated, reconstructed, altered or interpreted by AI.

Header proportions, placement and spacing must remain consistent throughout the report.

13. Footer

Standard report content pages use the approved minimal footer. **Left:** IO SKY · Confidential. **Right:** [Page Number].

The footer remains on the Off-White canvas. Do not introduce Deep Teal footer bars, decorative Orange logo treatment, unnecessary lines, Orange dots, repeated company metadata or excessive branding.

The footer exists for document identity, confidentiality and navigation. The Cover does not need the standard content-page header/footer treatment.

14. Mandatory Template-Driven Rendering Architecture

The AI must **not generate, design or freely compose the visual report on an assessment-by-assessment basis**.

The complete presentation architecture must already exist in the IO SKY platform as a **controlled, reusable and versioned Report Design System** before production customer reports are generated.

Approved Canonical Report Data -> Approved Section / Component Selection -> Fixed IO SKY Report Design System -> Deterministic Layout & Pagination -> Navigation & Internal Link Resolution -> Portal / PDF Rendering -> Rendering QA -> Publication

There must be no unrestricted **AI Prompt -> Independently Designed Customer PDF** workflow.

The AI supports the creation of structured assessment content. The AI does not receive authority to invent the final document design.

15. System-Controlled / Template-Controlled Elements

The following are controlled by the platform/report system rather than freely determined by AI: A4 format; Cover architecture; 21-section architecture; section order; Deep Teal/Orange/Off-White colour system; approved typography tokens after typography freeze; page grid; margins; spacing system; header; footer; Report Information structure; Contents structure; chapter-heading structure; finding components; recommendation components; relationship/dependency components; roadmap presentation components; continuation-page behaviour; pagination rules; page numbering; hyperlink treatment; PDF bookmark/document-outline behaviour; confidentiality treatment; Orange Usage Rule; approved component styling.

These elements must not be independently redesigned for each assessment. They should be implemented as a reusable, versioned report presentation system.

16. Dynamic / Assessment-Driven Elements

The following may vary according to the approved assessment: Organisation Name; applicable Scan Product; assessment context; organisation-specific information; strengths; findings; number of findings; finding titles; finding descriptions; observations; contributing factors; root-cause hypotheses where justified; confidence; impact; urgency; relationships; risks; constraints; opportunities; priorities; recommendations; decision considerations; roadmap substance; further-investigation items; cross-references; section length; page count; customer publication language; approved audience rendering.

Dynamic content may determine how much content exists and which approved presentation components are required. It must not determine a new visual identity.

17. Repeated Components

Where an assessment produces multiple instances of the same information type, the report renderer must reuse the corresponding approved component.

If an assessment contains six approved Key Findings, the system may render six instances of the approved Finding presentation structure and create continuation pages as necessary. It must not ask AI to design six different finding-page layouts.

The same principle applies to recommendations, strengths, risks, opportunities, connected insights, roadmap elements and further-investigation items. Variation comes from content, not arbitrary redesign.

18. Content Overflow and Pagination

Content must be allowed to grow naturally. When an approved component requires additional space, the renderer must preserve approved typography, readable spacing and information hierarchy; create continuation space/pages; maintain header/footer consistency; and maintain correct internal navigation.

It must not solve overflow by materially shrinking typography, removing approved content, hiding information, collapsing substantive sections, overlapping elements, clipping content or altering conclusions.

Pagination is a rendering consequence of content. It is not an assessment target.

19. Report Information

Report Information uses its controlled report structure and includes the approved report-identification information defined by the Master Specification and Clarification Addendum, including applicable Legal / Organisation Name, Country of Registration, Company Registration Number, Assessment ID, Scan Product, Report Version, Delivered Date and approved IO SKY issuer information.

Customer VAT/Tax ID is not printed in the customer-facing report merely because it exists in billing/administration unless IO SKY later explicitly approves that requirement.

Report Information remains separate from the Cover and Contents.

20. Report Contents

The Contents page uses the approved Report Contents reference. It must provide final report navigation based on actual generated pagination.

The Contents page does not need to create a navigation entry pointing to itself. Chapter entries must resolve to their correct final destinations.

The Contents page and its navigation are part of the fixed report system, while the resulting page numbers are dynamic.

21. Internal Hyperlinks and Cross-References

Internal report navigation must work in both the digital report experience and the downloadable PDF where technically applicable.

Examples include Contents -> Chapter; Finding -> Connected Finding; Finding -> Recommendation; Recommendation -> relevant roadmap/action; and other approved cross-references.

References such as Finding 03 or Recommendation 02 may use the approved Orange hyperlink treatment. Internal destinations must be calculated from the final paginated report version.

Broken, missing or incorrectly targeted links constitute a rendering QA failure.

22. PDF Bookmarks / Document Outline

The downloadable PDF must include the approved document outline/bookmark structure. At minimum, the required report chapters must be directly navigable through the document outline where supported by the final PDF specification.

Bookmark destinations must correspond to the actual final report locations and must not be based on provisional pagination.

23. Visual Restraint

The report prioritises editorial clarity. Do not introduce visual elements merely because space is available.

Avoid unnecessary icons, excessive cards, glass effects, glow, gradients, generic AI imagery, decorative illustrations, decorative charts, dashboard widgets, traffic-light interfaces, arbitrary status colours, unnecessary separators and excessive branding.

A visual component must serve an informational or navigational purpose.

24. Data and Chart Integrity

Quantitative charts or visualisations may only be used when the underlying approved assessment/customer data supports the quantitative representation. Qualitative information must remain qualitative.

The report system must not invent percentages, benchmarks, scores, trend lines, ROI, financial savings, maturity levels or quantitative comparisons merely to create a more visual page.

25. Approved Reference Images

The supplied Cover Reference, Report Contents Reference and Key Findings Reference are mandatory visual implementation references.

The Cover defines report entry, logo treatment, minimal branding, hierarchy, negative space, Scan Product presentation, Organisation presentation, Delivered date and Confidential treatment.

The Report Contents reference defines the standard header, Off-White content surface, chapter hierarchy, Orange chapter numbering, typography direction, whitespace, footer and restrained navigation styling.

The Key Findings reference defines the standard substantive content-page language, finding hierarchy, classification presentation, body hierarchy, observations, contributing factors, business-consequence treatment, cross-references, recommendation references, Orange usage, content density and footer treatment.

These references establish the system. They do not mean every chapter must physically look identical to the Key Findings page.

26. Design Consistency Across Customers

This is a mandatory requirement. Two reports generated for different customers must **not appear to come from different design systems**.

A customer-specific assessment may change **WHAT the report says**. It must not arbitrarily change **HOW an IO SKY report looks**.

Customers may have completely different findings, page counts, recommendations, Connected Insights and Roadmaps. Nevertheless, their reports must retain the same IO SKY identity, page system, typography, colour logic, component family, header/footer, hierarchy, navigation and visual quality.

The same applies across Operations, Cyber and Elite.

27. AI Design Boundary

AI may operate on approved structured assessment information according to the AI Scan Engine specification.

AI may not independently decide a new colour palette, font, header, footer, margins, report architecture, chapter names, arbitrary cards, arbitrary visualisations, decorative styles, alternative cover or new finding layout merely for variation.

AI output must be transformed into structured report data and rendered through the controlled IO SKY Report System. This boundary is mandatory.

28. Version Control

The report design system itself must be version-controlled. A published report must remain reproducible against the applicable approved report design/version and approved report content version.

A future IO SKY redesign must not silently change an already published historical report. Likewise, later Organisation master-data changes must not silently rewrite previously published report content.

29. Mandatory Production Reference Before Freeze

The supplied images define the visual target. Before the report system is considered visually production-frozen, the development team must generate a **real report reference through the actual implementation**.

At minimum, the implementation reference must demonstrate Cover; Report Information; Report Contents; substantive content page based on the Key Findings reference; header; footer; typography; Orange usage; pagination; continuation behaviour; internal hyperlink; PDF bookmark/document outline.

IO SKY will review this implementation. The exact typography and associated final design tokens become frozen only after explicit IO SKY approval.

30. Acceptance Criteria

ACC-RPT-001 - Universal Architecture: Operations, Cyber and Elite render using the fixed 21-section architecture and correct product-specific Roadmap naming.

ACC-RPT-002 - Visual Consistency: Multiple reports with materially different assessment content visibly belong to the same IO SKY design system.

ACC-RPT-003 - No AI-Driven Redesign: Different customer reports do not cause arbitrary changes to fonts, colours, header/footer, margins, component styling, chapter structure or overall visual identity.

ACC-RPT-004 - Dynamic Content: Different findings, recommendations, relationships and section lengths render correctly without requiring a new report design.

ACC-RPT-005 - Variable Length: A report may exceed 21 physical pages without content truncation, inappropriate typography reduction or layout failure.

ACC-RPT-006 - Continuation Behaviour: Long sections continue correctly while retaining approved typography, spacing, header/footer and hierarchy.

ACC-RPT-007 - Colour Accuracy: Deep Teal #0D2D2E, Orange #F58A1F and approved Off-White are correctly implemented.

ACC-RPT-008 - Orange Restraint: Orange is used for approved functional/reference purposes and is not introduced as arbitrary decoration.

ACC-RPT-009 - Logo Integrity: The supplied official IO SKY logo asset is used without regeneration, reinterpretation or unauthorised modification.

ACC-RPT-010 - Header Consistency: All applicable content pages use the approved header architecture consistently.

ACC-RPT-011 - Footer Consistency: All applicable content pages use the minimal IO SKY · Confidential + page-number footer consistently.

ACC-RPT-012 - Typography Approval: A real production typography reference has been reviewed and explicitly approved by IO SKY before final typography tokens are frozen.

ACC-RPT-013 - Contents Navigation: Every applicable Contents entry resolves to the correct final chapter location.

ACC-RPT-014 - Cross-References: Applicable Finding, Recommendation and other internal references resolve to the correct final destinations.

ACC-RPT-015 - PDF Bookmarks: The final downloadable PDF contains the required functioning document outline/bookmarks.

ACC-RPT-016 - Pagination Integrity: Navigation is calculated against final pagination rather than provisional page positions.

ACC-RPT-017 - Rendering Integrity: No clipping, overlap, missing content, broken components, unreadable typography or invalid page overflow exists.

ACC-RPT-018 - Chart Integrity: No quantitative visualisation appears without sufficient underlying quantitative data.

ACC-RPT-019 - Historical Integrity: Published reports remain immutable/reproducible and are not silently redesigned after later template or master-data changes.

ACC-RPT-020 - Cross-Product Consistency: Operations, Cyber and Elite remain recognisably part of one IO SKY report family despite differences in content and length.

ACC-RPT-021 - Reference Fidelity: Implemented Cover, Contents and Key Findings reference outputs meet the approved IO SKY visual direction.

ACC-RPT-022 - AI Boundary: No production path exists in which AI is permitted to freely design a customer-facing report outside the controlled template/component system.

ACC-RPT-023 - Production Rendering: The approved report is generated through the actual production report-rendering architecture rather than being manually recreated for acceptance.

31. Final Acceptance Principle

Every IO SKY AI Scan Report uses the same controlled visual system and fixed report architecture. The assessment changes the intelligence and content - not the identity or design of the report.

The system must support shorter and longer Operations reports, Cyber reports, Elite reports, different numbers of findings, supported customer languages and different audience emphasis while preserving one consistent IO SKY report identity.

The AI supplies intelligence within controlled structured data.
The Report System supplies the design.
Expert Review controls the approved substance.
The publication workflow controls what the customer receives.

That is the required production architecture.
